

Carton box assembler

KA125

The machine is loaded manually with approximately 100 flat carton boxes with the bottom end down into the loading station. As the box is pulled out of the station the box will be raised and bottom flaps turned in and taped with a 70mm tape over the bottom of the box. The box is then fed out of the machine and transported into KA148 if KA125 and KA148 are interconnected.
